FULL STACK ENGINEER | TYPESCRIPT (NEXT.JS, NESTJS) - C# / .NET - SQL SERVER | FINTECH

Summary

Full stack engineer, 4 years in financial systems, equally at home in TypeScript (Next.js, NestJS behind a BFF) and C#/.NET with SQL Server - the mix a legacy migration needs. As a junior, took a core endpoint from 242s to 12s; later rolled out authorization across 228 endpoints after an external security audit. Promoted to mid-level in 12 months.

Skills

Backend: TypeScript, Node.js, NestJS, C#, .NET 6/7/8, ASP.NET Core, Entity Framework Core, REST/OpenAPI, BFF pattern, domain-oriented service decomposition, SOLID

Frontend: Next.js, React, Tailwind, SWR, HTML5, CSS3, Flutter (mobile, desktop, web), WebSocket

Data and Performance: SQL Server, T-SQL, stored procedures, execution-plan analysis, indexing, transactions (ACID, Unit of Work), Redis

Security and Auth: OAuth2, JWT, Microsoft Entra ID, role and claim-based authorization, secrets management, OWASP-aligned remediation

DevOps and Quality: GitHub Actions, Azure DevOps, Azure Key Vault, SonarQube, xUnit, unit and integration testing, code review, on-call incident response, Agile/Scrum

AI tooling: Claude Code, Cursor, GitHub Copilot, MCP integrations, agent workflows, AI output verification

Experience

FinFast (Santiago, Chile) - Full Stack Engineer, Junior to Mid-Level Aug 2024 - Aug 2026

Fintech platform for factoring, guarantees, insurance and credit. Fully remote from Peru for a Chilean company. Stack: TypeScript (Next.js, NestJS) for new services, C#/.NET 6/7 and SQL Server for the legacy under migration, React, Redis, Azure DevOps.

Mid-Level Full Stack Engineer Aug 2025 - Aug 2026

- Built the front end, BFF and service layer of FinFlow (Next.js + NestJS), the internal delivery platform where a ticket auto-creates its GitHub branch and the flow runs from the UI or a chat client via MCP - adopted by every developer as the only path to close a user story.
- Built a decision engine (NestJS) that centralized business rules across services and distributed outcomes through a BFF, so pre-approved risk-team exceptions stopped breaking the flow and raising urgent tickets.
- Contributed to migrating legacy .NET services to NestJS with a coexistence strategy (versioned views and stored procedures, segmented schemas): both ran in parallel in production, no mass data migration. Co-built 3 GitHub Actions workflows: deploys from 30+ min to 4.
- Implemented endpoint-level authorization across 228 endpoints - roles and claims with a dynamic permission scheme in Redis, plus OAuth2/JWT via Microsoft Entra ID - closing the critical findings of an external ethical-hacking audit (CWE-285, 256, 602, 200, 693, 497) and leading the technical coordination of the fix.
- Helped build Hermes, a Teams agent grounded on product docs that resolves recurring incidents (~90% autonomously on factoring and insurance) and reviews pull requests. Ran my AI-assisted work through a written verification loop that caught requirements the model falsely reported as done.

Junior Full Stack Developer - promoted after 12 months Aug 2024 - Jul 2025

- Volunteered as a junior for the core invoice-management endpoint and cut its latency from 242s to 12s for the 29 operations staff using it daily: rewrote critical stored procedures, redesigned indexes across 6+ tables, paginated and decomposed the endpoint, and moved business validations from React to the backend. Query cost ~125,000 ms to ~2,300 ms; logical reads ~4.5M to ~23K. One of the reasons for my promotion.
- Rebuilt payroll batch processing with a Unit of Work and a single commit per batch: ~103s to ~3.4s per payroll (14 payrolls: ~24 min to ~48 s) and 672 commits to 14, eliminating inconsistencies in ~15% of records. Covered the refactored flows with xUnit tests.

9780 Bitcoin (Arequipa, Peru) - Frontend Engineer, Fintech Products Feb 2023 - May 2024

Currency exchange house. Built the client interface for a cryptocurrency exchange in Flutter across mobile, desktop and web, integrating the Binance API for 30-second price updates and hardening validation on money-moving flows.

- Shipped a real-time crypto price feed (React and WebSocket) that ran in production on RPP Noticias, one of Peru's largest news sites, coordinating the release with the external engineering team.

Tres Niveles - Junior Web Developer (remote from Arequipa to Lima) Oct 2022 - Feb 2023

Two client websites end-to-end on WordPress, PHP and MySQL, from Figma prototype to production.

Certifications and Education

AWS Certified Cloud Practitioner (CLF-C02) - in preparation, exam planned Dec 2026; Solutions Architect - Associate next
Unit Testing with C#/.NET (Platzi) | Azure Fundamentals (Código Facilito, 2026) | AI Development (BigSchool, 2026)
B.Eng., Computer and Systems Engineering - Universidad de San Martín de Porres, Peru, 2020-2024 (conferred 2026)
